

New Technology

There's all kinds of new technology coming to market every month, some really cool, some causes you to wonder why. A technology that came out about 12 months ago are super thin USB powered monitors. You may wonder why? I don't know what the inventors had in mind, but the monitors are being gobbled up by road warriors and outside sales people wanting a 2nd monitor to connect to

their Notebooks. They can be used with any computer, not just notebooks. The monitors are in the 15"-17" range, which makes them about the same size as a 14" display notebook and fit nicely in a notebook case. They draw power from the notebook as well as pulling the video signal over the USB connection. They come with a screen cover that doubles as a stand AND they aren't that expensive, starting around \$140.00. There are more expensive ones that are touch screen. For people who are used to dual monitors at work, this is a more than acceptable solution for away-from-work.
