

# Spectre/Meltdown UPDATE!

## The good news

Microsoft has released its fix for Spectre/Meltdown and most manufacturers have firmware and BIOS updates to finish the fix.

## The bad news

Not all manufacturers have finished their work on patches while others don't see Spectre/Meltdown as a threat to their devices.

## What it means to you

It's time to do the firmware/BIOS updates on your PC's, Servers, Firewalls, and other devices on your network (and at home).

## How do you do it?

Microsoft updates are easy, just open Cortana or Run and type "Windows updates" and choose "Check for Updates", then follow the prompts. You don't have to do much other than read the screen and follow instructions.

BIOS and Firmware updates are a bit more complicated and may require technical assistance. If you are good at following written directions, they can be accomplished too.

We will probably be contacting you in the next week or so to discuss the state of your patching and firmware.
